

Is Bangladesh's Power Grid Fair?

A Load-Shedding Equity Analysis, 2019–2024

Public dataset (BPDB, via Mendeley) · SQL/PostgreSQL analysis

Is the burden shared evenly — or is Dhaka protected?

THE QUESTION

Bangladesh's national grid sheds electricity load unevenly. Does Dhaka — the capital, with by far the largest demand — get protected from cuts, while the rest of the country absorbs them?

THE METHOD

Measured as load-shedding as a % of each division's own demand, not raw MW. Dhaka's demand is so much larger than other divisions that raw MW numbers would make Dhaka look like it suffers most — when it actually just has more electricity to lose. The % metric removes that bias

Mymensingh carries the heaviest burden — every year since 2022

Who's shed the most, 2019–2024

% OF DEMAND SHED, ALL YEARS POOLED

Yes — the burden is uneven

Mymensingh has ranked the most-shed division every single year since 2022 — shedding up to 9x more of its own demand than Dhaka in the same year. Dhaka has ranked last or near-last in every one of those years
